

Never stop thinking.

Infineon Ident Solutions – Proven RFID expertise and technical competence.

One-stop shop
for all your
RFID needs

Founded in 2000, Infineon Technologies Ident Solutions has grown to become one of the leading suppliers of RFID solutions. The group already has a strong technical base and can draw on further RFID competences from a wide network of wireless and software capabilities within Infineon. Infineon Technologies Ident Solutions products bridge the technology gap between RFID product manufacturers and the large consultancies and enterprise software companies. Our approach is technology independent, using fit-for-purpose products to develop, install and maintain tailor-made RFID systems infrastructure worldwide. Using Infineon's RFID system integration platform You-R® OPEN, an operating system which has been developed specifically for RFID technologies, we can link a company's existing logistics IT landscape to the RFID-supported logistics system. You-R OPEN supports the entire RFID infrastructure - from smart labels to readers, PC and servers – to link to corporate IT networks. It enables the integration of RFID systems into a company's internal IT landscape using J2EE, Microsoft .net, http, C++, XML or PML programming. Existing corporate logistics systems can be converted to RFID-supported processes using standard development tools. The platform You-R OPEN also makes it possible to perform maintenance, diagnose faults and update the software for the RFID hardware via a remote connection.
